
THE MUNICIPAL LIQUIDITY FACILITY

Andrew Haughwout, Ben Hyman, and Or Shachar

OVERVIEW

- The Federal Reserve’s actions in response to the COVID-19 pandemic included support for the state and local government sector via the Municipal Liquidity Facility (MLF)—a sector that contributes more than 10 percent to U.S. GDP and employs 20 million workers.
- This study reviews the creation and implementation of the facility, which offered three-year loans at penalty rates to a set of eligible municipal and revenue bond issuers.
- Analysis suggests that the MLF, in spite of limited take-up, played a significant role in improving conditions in the municipal bond market by a variety of measures. However, effects on real economic outcomes like employment in the municipal sector are harder to attribute to the facility.
- Limited eligibility and penalty pricing may have blunted the facility’s impact. The authors note that further research focused on the price elasticity of demand for short-term borrowing by municipal issuers under fiscal stress is warranted.

At the onset of the COVID-19 pandemic, state and local governments were among the sectors expected to experience the most severe distress. These governments’ dependence on revenue streams that were either rapidly declining or delayed, along with severe dislocations in municipal debt markets, created a “perfect storm” of developments that threatened their ability to function effectively when they were most needed. Many analysts predicted a state and local fiscal crisis that could be unprecedented in speed, severity, and scope.

In the spring of 2020, the Federal Reserve System, in collaboration with the U.S. Treasury, established for the first time a program under which it offered short-term funding to states, localities, and other municipal entities. In this article, we discuss the basic economics of state and local governments and the ways they use debt. We then turn to the motivation for the Municipal Liquidity Facility (MLF), as it was called, while the COVID-19 pandemic was causing severe disruptions in the municipal bond market. We provide details on how the MLF was set up, how it operated, and what is known about the effects it had on the sector and the economy.

1. BACKGROUND

1.1 State and Local Government Finances

The state and local government sector is a unique but economically very important part of the U.S. economy. In calendar year 2019, the last full year prior to the pandemic, state and local government consumption and gross investment totaled \$2.3 trillion in the National Income and Product Accounts. This amount represented 10.9 percent of GDP in that year, a figure that had been above 10 percent since the mid-1960s. At the end of 2019, the sector employed nearly 20 million workers, ranging from police officers to state governors.

State and local governments, unlike the federal government, are primarily in the business of direct service provision.¹ Public safety, education, transportation, and sanitation are just a few of the services where these governments play an important role. One additional area, especially important in a pandemic, is health care. Maintaining these services in periods of economic and fiscal stress is a challenge, particularly because the sector is also unique in its financing. State and local governments are generally required by their constitutions or by statute to balance their operating budgets—in other words, they are not allowed to spend more than they collect in revenue. These balanced budget requirements (BBRs) are intended to help control spending and reduce intertemporal burden shifting. Therefore, state and local governments primarily issue long-term debt in order to finance long-lived infrastructure investments like bridges, sewers, and schools. Thus, while there is a very large market in long-term municipal bonds, those bonds are usually sold to finance capital projects and not to spread the costs of economic downturns or fiscal stress.²

BBRs, however, can have some unintended effects in aggregate. In particular, they tend to induce some pro-cyclicality in the behavior of the sector as a whole. Generally speaking, as the economy contracts, state and local government tax bases decline as well, leading to pressure for reductions in (expected or realized) tax and fee revenues. BBRs force public officials to make difficult choices to increase tax rates—further reducing private disposable income—or to cut spending. In addition to the human toll caused by reduced incomes and/or employment, and the likely deterioration in the core public services produced by the sector, these actions put further downward pressure on economic activity, just as the economy is weakening.

The structure of state and local government budget processes does tend to build some lags into these responses: Subnational governments' fiscal years typically begin in July and end in June, and unanticipated changes in the economy after budgets are adopted may not produce immediate changes in spending or taxes. In addition, much of the sector's revenue (and direct spending) is at the local level, where dependence on property taxes is high. Since assessed property values are less strongly correlated with overall activity than sales and income are—sales and income being states' primary tax bases—local budgetary pressures tend to lag even further, becoming apparent when assessed property values fall and/or when state aid (a crucial part of local budgets) is cut.

These features of the sector were apparent in the 2007-09 recession. In the roughly two years between the second quarter of 2005 and the third quarter of 2007, state and local government activity contributed an average of +7 basis points to aggregate GDP growth. The economy was expanding for most of this period, and state and local governments were contributing positively to that growth, albeit slightly. In the early stages of the recession that began

CHART 1

State and Local Government Employment

Source: U.S. Bureau of Labor Statistics.

in late 2007, the sector's growth contributions actually increased—state and local government activity averaged a contribution of +20 basis points as the economy experienced its first four quarters of recession. But by late 2008, the sector's growth contribution turned sharply negative, and its annual contribution remained negative through 2013. Employment in the sector, shown in Chart 1, fell sharply beginning in the middle of the recession, and did not recover to its pre-recession level until the end of 2015. The sector's slow rebound, then, was part of the explanation for the slow national recovery from the Great Recession, making the sector's resiliency an area of concern for future macroeconomic policy.³

1.2 Municipal Debt

There are two important qualifications to the important role that BBRs play in the state and local sector. We have already briefly discussed the first: the issuance of long-term municipal bonds as a mean of financing long-lived infrastructure investments like public buildings, roads, and water systems. The second is the ability of many municipalities to use short-term notes to smooth cash flows within a fiscal year. In this section, we will provide an overview of these markets, as they are important for understanding the purposes and limitations of the MLF.

Bonds

The \$3.8 trillion municipal bond market contains more than 50,000 issuers and one million individual bonds, making it approximately half the size of the corporate bond market with ten times as many issuers. Roughly 90 percent of this market is exempt from federal income tax, and more

CHART 2
Municipal Bond Holders, 2004–20

Source: Board of Governors of the Federal Reserve System.

Notes: The category for Individuals includes households and nonprofit organizations. Mutual funds includes mutual funds, money market funds, closed-end funds, and exchange-traded funds. Banking institutions includes U.S.-chartered depository institutions, foreign banking offices in the United States, banks in U.S.-affiliated areas, credit unions, and broker-dealers. Insurance companies includes property-casualty and life insurance companies. Other includes nonfinancial corporate business, nonfinancial noncorporate business, state and local governments and retirement funds, government-sponsored enterprises, and municipal securities held by the COVID-19 Municipal Liquidity Facility and foreign holders. The discrepancy is the accumulated valuation difference between issuance and holdings.

than 80 percent is rated investment grade. Consequently, default rates on rated municipal bonds have historically been very low, although unrated bonds have defaulted more frequently (Appleson et al. 2012; Moody’s 2020). As of May 2020, 26 percent of outstanding debt was issued directly by state, city, county, and other local governments, 41 percent by utilities, service, and transit issuers, 21 percent by school districts, and 8 percent by public hospitals. Unlike Treasury and corporate bond markets, 70 percent of municipal debt is held by retail investors seeking tax advantages associated with municipal bond returns, with a third of that total in mutual funds and exchange-traded funds (see Chart 2). Unlike the corporate sector, municipal debt is also commonly issued in deals containing many different tenors as independent bonds, facilitating more predictable budget smoothing but complicating the analysis of the market.

General obligation (GO) bonds, which constitute approximately 30 percent of the long-term municipal market, are not secured by a specific revenue source but are instead backed by the “full faith and credit” of the taxing authority and typically finance capital projects like bridges and schools. The large remainder of the long-term market (60 percent) is dominated by revenue bonds (RB), frequently issued by public enterprises and secured by defined revenue sources (such as transit user fees, airport revenues, and road and bridge tolls).

Notes

Less well known but quite important in general and specifically in the pandemic, state and local governments also frequently leverage the \$440 billion short-term municipal note market to bridge cash flow gaps *within* fiscal years. This short-term borrowing can be useful because states and localities depend on revenues (tax receipts, federal grants, the proceeds of bond issues, and other revenues) that are received at specific intervals during the fiscal year. But the timing of spending needs—for example, for payroll—may not be well-matched with the arrival of receipts, creating a need for a way to smooth spending in anticipation of such receipts. These governmental entities can do so by issuing tax anticipation notes (TANs), revenue anticipation notes (RANs), tax and revenue anticipation notes (TRANs), and bond anticipation notes (BANs). These notes are typically secured by funds expected to be received later in the fiscal year and are paid off when the relevant funding is received. Note that issuers typically seek funding at the same time each year, and market access is critical to maintaining liquidity.

A classic example of a mismatch between the timing of receipts and expenditure needs is the proceeds from final settlement of state income tax returns. In most states that levy an income tax, these settlements are due on the federal government's tax day, typically April 15. For states like New Jersey, these final settlements are often substantial (New Jerseyans in aggregate owe a substantial amount of tax on unearned income and capital gains) and many of these proceeds are received right around the end of the state's fiscal year, which closes June 30. The value of these settlements is based on activity that occurred in the previous calendar year, so it is known with a relatively high degree of confidence. Therefore, New Jersey could issue a TAN in January, with a maturity of April 30, to enable it to spend part of the expected settlement amount in the interim.

It is important to note that the primary market interest rates at which governments issue new debt in the municipal market are strongly linked to secondary market yields. This is because primary market pricing is usually benchmarked to secondary market prices of similar bonds, and the willingness of dealers to underwrite bonds is affected by market conditions (Boyarchenko et al. 2020). Price discovery occurs through submissions to exchanges, and is exceptionally low in this market in part due to the low volume of transacted trades (Green et al. 2010). In an average expansion year (such as 2019), there are 6,500 trades a day, with a median trade size of about \$30,000, far less frequent and at lower volumes than corporate bonds (Haughwout, Hyman, and Shachar 2021).

2. STATE AND LOCAL BUDGETS IN THE ERA OF COVID-19

As the cataclysmic economic consequences of the pandemic began to become evident in the United States during spring and summer of 2020, several concerns directly related to states and municipalities came to the fore. First, many analysts predicted dire consequences for the revenues of state and local governments. Disruptions to economic activity threatened virtually all forms of the sector's revenues. One analysis (Fiedler and Powell 2020), using data from previous downturns, suggested that each year-over-year percentage point increase in the unemployment rate had historically been associated with a \$45 billion deterioration in the fiscal situation of state and local governments, the vast majority of which consists of revenue declines associated with reduced

economic activity. In April 2020, the unemployment rate stood at 14.7 percent, a stunning 11.1 percentage points higher than its level a year earlier (and 11.2 percentage points above its level of two months earlier, in February 2020). This change suggested an annual fiscal shock of around \$500 billion to the sector. Fiedler and Powell (2020) describe several sources of uncertainty in this estimate, including reasons to have expected the shock to be larger (for example, noting that business closures may mean that the sales tax elasticity to unemployment turns out to be larger than usual) or smaller (observing that the increase in unemployment was unusually concentrated among low-wage workers, thereby reducing the income tax elasticity to below-normal levels). By mid-summer, it was becoming clear that at least some of the sharp increase in unemployment was transitory. By July, the rate stood at 10.2 percent, still far above its year-ago level, but already down 450 basis points from its April peak. Estimates from this period suggested state fiscal impacts in the neighborhood of \$75-\$100 billion for fiscal year 2020, and \$100-\$300 billion for 2021 (Dadayan 2020; McNichol and Leachman 2020; Auerbach et al. 2020 estimated a fiscal year 2021 effect of \$167 billion for state and local governments combined).⁴

In addition to the employment rebound, several factors contributed to this improvement in the outlook for states. Employment losses were concentrated in relatively low-wage jobs, and incomes of the unemployed were supported by supplemental unemployment compensation payments, which are typically taxable incomes for states. Both of these factors moderated the income tax revenue effect of the downturn relative to what might have been expected. In addition, while consumption fell dramatically in the pandemic's early days, the largest declines were in services, while more heavily taxed goods consumption was less affected, helping to stabilize sales tax revenues.⁵ A final bright spot in the outlook was property taxes, which are the primary source of own-source local government revenue and which, buoyed by high home price growth, remained strong into 2021.⁶ Nonetheless, the state and local sector as a whole had shed more than 1.3 million jobs very early into the pandemic, primarily in local education, and concerns for state and local governments remained heightened through much of 2020.⁷ The fact that so many jobs were lost in local education just as schools were closing for public health reasons, along with the slow subsequent recovery in the sector in spite of a brightening fiscal picture, suggest that a shortage of revenues—or even the expectation of a revenue decline in the near future—was not the key concern. Rather a lack of demand for bus drivers, cafeteria workers, and school maintenance staff in a “learn from home” environment may explain the employment losses in spring 2020.

A second major concern was with the need for states, and especially localities, to increase spending to mitigate the effects of the COVID-19 pandemic. A survey conducted by the National Association of Counties found that if the pandemic were to last a year, more than 1,100 counties expected to spend at least 10 percent of their budgets on fighting the virus, and in aggregate counties expected nearly \$30 billion in additional spending, largely for support of county hospitals and local health agencies.⁸

A third area of concern was that the policy decision to move the federal income tax filing deadline from April 15 to July 15 might create a need for new sources of liquidity for many states. The change in the filing deadline created a substantial budget shortfall for the many states that depend on income taxes, but it was one that seemed almost certain to be largely made up in July 2020, given that the receipts that were due with final settlements were based on activity that took place in 2019 and so would be virtually unaffected by the pandemic.⁹ As a consequence, many observers expected a spike in the demand for short-term financing—TANs—to fund the

CHART 3

Monthly Municipal Bond Issuance, January 2019–May 2021

Source: SIFMA.

cash flow needs of these states and localities (yet where localities do not tax incomes but instead rely on property taxes, this change would not have a direct impact).¹⁰ Given the importance of final income tax settlements in those states where the income tax is a significant revenue source, the delay itself was consequential, and it became even more of an issue when combined with the fourth major concern, the “freezing up” of the municipal market, which we describe next.

The municipal bond market, like other financial markets, became severely stressed as the pandemic began to take hold in March 2020. Yields on municipal securities spiked in mid-March, and issuance dried up almost entirely (see Chart 3). For example, the average yield on a AAA-rated thirty-year bond rose 180 basis points between March 2 and March 23, and issuance fell well below its average levels for the prior five years (Cipriani et al. 2020).¹¹ At the moment when a clear need for short-term liquidity was presenting itself, the market for lending was drying up. Chart 4 shows this spike, and also the rapid recovery that followed for most but not all issuers.

An important correlate of the increase in market stresses in the beginning of March was mutual fund outflows. Open-end mutual funds are the largest institutional investors in municipal securities, holding about 20 percent of outstanding municipal bonds. Although mutual funds’ municipal holdings are smaller than those of retail investors, the impact of their redemptions on municipal bond yields was substantial during March 2020. In the first two months of 2020, mutual funds investing in municipal securities had received inflows totaling \$22 billion. This continued a trend of record inflows experienced throughout 2019, when total inflows were \$90 billion. But the direction reversed suddenly in March, resulting in outflows of \$43 billion in that month alone (Cipriani et al. 2020). Li, O’Hara, and Zhou (2021) show that the behavior of issues held by mutual funds, while similar to that of issues not held by funds before the COVID-19 pandemic, diverges both during and after the crisis. Specifically, the drastic increase in trading volume during the crisis was entirely driven by the trading

CHART 4
 Turmoil in Secondary Municipal Bond Yields during COVID-19

Notes: VRDN is variable-rate demand note. MMLF is Money Market Mutual Fund Liquidity Facility. MLF is Municipal Liquidity Facility. The MLF’s population cutoffs for county and city issuers were 500,000 and 250,000, respectively.

of bonds held by mutual funds, and bonds that suffered larger redemptions experienced larger price deterioration.

This combination of a sharply deteriorating revenue picture, a pressing need for additional expenditures, delays in the receipt of substantial taxes owed, and an inability to access the financial markets was enough to raise serious concerns among many observers about the

ability of state and local governments to continue to meet their public service delivery responsibilities.

3. THE MUNICIPAL LIQUIDITY FACILITY

3.1 Purpose and Size

On April 9, 2020, the Federal Reserve announced the establishment of the MLF to help state and local governments manage the cash flow challenges that the pandemic produced. MLF was a direct result of the Coronavirus Aid, Relief, and Economic Security Act (CARES Act), which, among many other things, directed the U.S. Treasury Department to make loans or investments in Federal Reserve facilities intended to provide “liquidity to the financial system that supports lending to eligible business, states or municipalities.”¹² Treasury committed to invest up to \$35 billion in the special purpose vehicle that was set up to operate the facility, and initially funded \$17.5 billion, thus sharing any credit risk with the Federal Reserve.¹³ Treasury’s investment was drawn from the Exchange Stabilization Fund.

The facility was announced as having a \$500 billion lending limit, a figure that far exceeded the typical issuance in the market for short-term municipal notes, which had been less than \$100 billion in 2019. There were indeed unusually severe strains on liquidity in the sector, as discussed in Section 2, and estimates of the demand for short-term lending were quite uncertain, so the figure was intended to be large enough to send an important signal to the market. As Kent Hiteshew, who served as Deputy Associate Director for Financial Stability at the Federal Reserve Board and was instrumental in the creation and implementation of the MLF, stated subsequently, “Rather than an attempt at measuring actual loan demand, the \$500 billion MLF sizing was based more on the goal of making sure the market understood that the Fed and Treasury were fully committed to using all of our resources to support stabilization and then restore normalization of the municipal market.”¹⁴ Indeed, the \$500 billion facility size was approximately equal to 20 percent of the “own source general and utility revenue” (OSGUR) of *all* state and local governments in 2017. The closing date for the facility—the date after which it would cease purchasing notes—was set at December 31, 2020.

The initial MLF term sheet accompanying the announcement on April 9 was ultimately amended, as shown in Exhibit 1, which provides a detailed timeline of MLF developments. Nonetheless, these subsequent changes to the eligibility and terms of the MLF left its purpose and this \$500 billion overall size unchanged.

3.2 Eligible Issuers, Notes, and Borrowing Limits

The April 9 announcement defined “eligible issuers” as all fifty states, the District of Columbia, cities with a population exceeding one million, and counties with populations exceeding two million. Population figures were taken from the U.S. Census Bureau’s most recent complete data: 2018 for cities and 2019 for counties.

EXHIBIT 1

Municipal Liquidity Facility (MLF) Timeline

Source: Authors' calculations from MLF public announcements.

Limiting eligibility in this way was intended to ensure that the facility would not face an unmanageable number of counterparties. If even a relatively small portion of the municipal bond market's 50,000 issuers had sought funding from the MLF, the facility would have faced significant administrative challenges, as noted by Hiteshew in his September 20, 2020, Congressional Oversight Commission testimony. In addition, the initial language of the term sheet suggested that eligible issuers might use their borrowing as a mean of supporting their "political subdivisions and instrumentalities," suggesting the potential that MLF funding could be "downstreamed" to cities, towns, and authorities, including those that were not directly eligible for the facility. The idea was that states, which have significant experience allocating funding to their subdivisions, in particular might act like a clearinghouse for the provision of liquidity from the Federal Reserve to where it was needed most.¹⁵ Even if states were unable or unwilling to provide liquidity to their smaller municipalities, the provision of liquidity directly to some of the largest issuers in the market (states and the largest sub-state general purpose governments, which are responsible for the vast majority of trades in the market), combined with the facility's large size, was thought to help ensure that the market would open for all issuers.¹⁶

Nonetheless, the relatively small number of issuers eligible under the initial announcement drew criticism on a variety of grounds.¹⁷ On April 27, the Federal Reserve released a revised term sheet expanding eligibility to cities with population above 250,000 and counties over 500,000 as well as certain "multi-state entities," such as the Port Authority of New York and New Jersey.¹⁸ This change constituted a fairly major expansion of eligibility but still left several states in which the state government was the sole eligible borrower. On June 3, facility eligibility was expanded further to include at least two cities or counties in each state, as well as up to two additional municipal issuers "whose revenues are generally derived from operating government activities," a reference to transit systems, airports, and other utilities.¹⁹ The later expansions of eligibility opened the door to additional issuers, and specific language was added to the term sheet to ensure that the issuers held an investment-grade rating as of April 8, 2020. This date allowed for the possibility that "fallen angel" issuers, whose ratings were reduced as a consequence of the pandemic, could access the facility.

The maximum maturity for eligible notes in the original announcement was twenty-four months from date of issuance to the facility; this maximum was extended on April 27 to thirty-six months. The relatively short maturity was intended to provide assistance that reflected the realities of municipal issuers' fiscal institutions and that states and localities would generally be able to actually use. (Recall that the use of long-term borrowing is typically sharply restricted under state and local law.) Indeed, many municipalities must repay short-term borrowing within the fiscal year, but the expectation was that some would be able to relax these tight constraints somewhat, making a two- or three-year term practicable. In any event, the CARES Act called for a facility that would support the cash management needs of states and municipalities, and this was an additional argument for restricting maturities.

Issuance limits were determined by the size of the eligible *government*, as measured by own-source general plus utility revenue in fiscal year 2017, as reported by the Census of Governments. The use of Census of Governments data was intended to avoid complications from variations in accounting standards. Census of Governments data are self-reported by the governments in question and are reported in a standard accounting by the Census Bureau. Data for 2017 were chosen in part because they were already publicly available at the facility's inception and were based on a census (a 100 percent sample) rather than the smaller samples used in years between censuses.

The decision to use the OSGUR revenue concept reflects the complexity of the sector, which receives revenues from its own activities as well as from other levels of government and from the operation of insurance trust funds such as those for employee pensions. OSGUR is a measure of the revenue that governments, including their dependent public utilities like water districts or transit systems, raise themselves, generally through taxes and fees. The share—20 percent—was chosen to reflect the potential for a very severe downturn as well as the timing issues that were expected to arise from the change of the federal tax filing deadline to July 15, producing a large facility of about \$500 billion. The facility size was approximately equal to 20 percent of the OSGUR for all the governments in the sector.

3.3 Pricing

On May 11, the Federal Reserve released the initial pricing schedule for MLF lending. Prices for tax-exempt issues were expressed as a series of spreads to overnight index swap rates (OIS), with the spreads ranging from 150 basis points for AAA/Aaa-rated issuers to 380 basis points for BBB-/Baa3 issuers.²⁰ Below-investment-grade issuers were assigned a spread of 590 basis points. Taxable issues were priced at the applicable tax-exempt rate divided by 0.65 to reflect the value of the tax exemption. Each issue to the MLF was also required to pay an origination fee equal to 10 basis points of the principal amount.

These rates were, as required by the Federal Reserve's Regulation A for its Section 13(3) programs, set as "penalty" rates relative to normal market pricing.²¹ Nonetheless, MLF rates were criticized by many for being too punitive, especially for higher-rated borrowers after the market began to normalize. On August 11, as spreads in the market came down, MLF pricing was reduced by 50 basis points across the board, producing the price schedule shown in Table 1.²² Taxable rates were reduced somewhat more, as the adjustment factor went from 0.65 to 0.70, thereby narrowing the spread between the tax-exempt and taxable rates.

TABLE 1

Municipal Liquidity Facility (MLF) Pricing Schedules for Tax-Exempt Issues

Rating	Spread to OIS (Basis Points)	
	May 11, 2020	August 11, 2020
AAA/Aaa	150	100
AA+/Aa1	170	120
AA/Aa2	175	125
AA-/Aa3	190	140
A+/A1	240	190
A/A2	250	200
A-/A3	265	215
BBB+/Baa1	325	275
BBB/Baa2	340	290
BBB-/Baa3	380	330
Below investment grade	590	540

Source: MLF Term Sheet - Appendix B, August 11, 2020. <https://www.federalreserve.gov/newsevents/pressreleases/files/monetary20200811a1.pdf>.

Note: OIS is overnight indexed swap.

These revised rates generally remained above the rates that could be found in private markets for issuers in most credit ratings, although the substantially slower recovery of yields for issues carrying lower credit ratings meant that MLF participation was attractive for the relatively small set of issuers in the A and BBB ratings groups. Indeed, only lower-rated issuers actually issued notes to the facility during its lifetime, providing indirect evidence of the importance of the pricing. We discuss more fully the impact of the facility across the ratings distribution in the next section.

3.4 Operations, Issuance, and Wind-Up

Under the MLF, the Federal Reserve Bank of New York (the Reserve Bank administering the facility) committed to lend to a special purpose vehicle (SPV) on a recourse basis, secured by all of the assets of the SPV. The New York Fed was the managing member of the SPV, which was known as Municipal Liquidity Facility LLC. The SPV purchased eligible notes directly from eligible issuers at the time of issuance. The MLF officially opened on May 11 with the posting of a Notice of Interest and instructions for how eligible issuers could participate in the program. Eligible issuers were instructed to determine their financial needs and repayment schedule, then inform the New York Fed of their intention to participate.²³ The New York Fed and the SPV hired several vendors to consult on the MLF's structure, to evaluate the credits presented, and to administer the facility.²⁴

Over the MLF's lifetime, only two issuers actually sold notes to the facility: the state of Illinois and New York's Metropolitan Transportation Authority (MTA). Table 2 reports the details

TABLE 2
Municipal Liquidity Facility (MLF) Transactions

Issuer Name	Type of Governmental Entity	CUSIP	Date Transaction Entered Into	Closing Date	Face Value of Note When Issued to the MLF (Dollars)	Maturity Date of Note	Interest Rate or Coupon on Note (Percent)	Origination Fee (Dollars)
State of Illinois	State	4521526N6	6/2/2020	6/5/2020	1,200,000,000	6/5/2021	3.36	1,200,000.00
State of Illinois	State	4521527U9	12/14/2020	12/17/2020	2,000,000,000	12/15/2023	3.42	2,000,000.00
Metropolitan Transportation Authority (NY)	Designated Revenue Bond Issuer	59261AG92	8/18/2020	8/26/2020	450,720,000	8/1/2023	1.93	450,720.00
Metropolitan Transportation Authority (NY)	Designated Revenue Bond Issuer	59261CAA1	12/9/2020	12/17/2020	2,907,280,000	12/15/2023	1.33	2,907,280.00

Source: MLF-specific transactions disclosures, May 10, 2021. See <https://www.federalreserve.gov/monetarypolicy/muni.htm>.

of these transactions. Illinois's issuance of a total of \$3.2 billion represented about one-third of the state's maximum eligible borrowing, but the MTA ultimately borrowed its maximum allowable amount, \$3.358 billion.

It is notable that both of these issuers were relatively low-rated by the nationally recognized statistical rating organizations.²⁵ Illinois's average rating was BBB- at the time of both of its issuances to the facility, while the MTA's original note, secured by an anticipated Transportation Revenue Bond issue, was priced advantageously given a favorable rating from Kroll, Inc.²⁶ The MTA's second, December, note was secured by an anticipated Payroll Mobility Tax bond issue, which was rated AA+/Aa1. Not surprisingly, issuers appear to have compared the rates they would be required to pay to the MLF with market pricing and chosen whichever option offered the lowest rates. The MTA's initial \$450 million issue, for example, received competitive bids of 2.79 percent, versus the 1.93 percent it received from the MLF.²⁷ The state of New Jersey considered a \$4 billion sale to the MLF but reported that its advisor found market pricing more advantageous, and the state issued publicly instead.²⁸ For both Illinois and the MTA, MLF pricing for the financing they sought was the most favorable, or at a minimum favorable enough to make the utilizing the facility appealing. The fact that both were relatively low-rated issuers suggests that MLF terms were somewhat more favorable for riskier borrowers, although take-up of the facility was quite low even among low-rated issuers. We discuss this subject further below.

On November 19, 2020, then-Treasury Secretary Steven Mnuchin sent a letter to Fed Chair Jerome Powell requesting that the Federal Reserve return the unused portion of the Treasury's initial investment in the various facilities that were supported by Treasury funding, including the MLF, effectively enforcing the closure of the facility to new purchases, as scheduled, on December 31.²⁹ As shown in Table 2, the MLF's two borrowers, Illinois and the MTA, each completed a transaction shortly before the closure, in mid-December. On June 5, 2021, Illinois completed repayment of its initial \$1.2 billion note, having voluntarily prepaid the debt starting in November 2020.

4. EFFECTS OF THE MUNICIPAL LIQUIDITY FACILITY

Between mid-March (when the CARES Act was announced and stated that the Treasury and the Federal Reserve would provide cash management assistance to municipal borrowers) and the official closure of the MLF at the end of 2021, municipal market conditions improved significantly. This improvement can be seen in a variety of measures, from secondary market yields (see Chart 4) to issuance. Indeed, by year-end, municipal issuance in 2020, in the midst of a pandemic, reached \$484 billion—a record total and 14 percent above the 2019 level.³⁰ The improvement was not even across the board, however, and the recovery for the lowest-rated segment of the market was considerably slower, as can be seen in the chart. Nonetheless, by late summer, even BBB yields had retraced most, if not all, of the spikes that occurred in March.

While the overall recovery in the market during the first few months of the MLF's existence is dramatic and undeniable, it is challenging to determine what, if any, of this improvement can be attributed to the facility itself. Both the facility's announcement and its opening occurred at the same time as other federal interventions. For example, the Federal Reserve's Money Market

Mutual Fund Liquidity Facility (MMLF) was established on March 18. Mutual funds are major holders of municipal securities, and they had experienced \$43 billion in outflows during March, a figure equal to almost half the previous year's inflows. Similarly, the CARES Act included \$150 billion in funding for a new Coronavirus Relief Fund, which provided support for state and local governments to cover expenses related to COVID-19. In addition, the Federal Open Market Committee voted to cut the federal funds rate to a range of 0-0.25 percent by March 16.

To a very small sample of market participants who offered feedback on the facility to the authors, the MLF was clearly associated with substantially improved market functioning, although many also attributed a significant role to other elements of the federal government's interventions—particularly the MMLF but also CARES Act direct aid and the fact that the state and local government revenue picture improved dramatically as the year progressed.

The body of research on the effect of all these interventions, collectively and individually, is relatively small at this early date. Bi and Marsh (2020) study the impact of varied fiscal and monetary policy interventions on municipal bond market performance in the wake of COVID-19 by analyzing daily time series effects around the various announcements. They do not focus explicitly on the MLF, but find that long-term, low-rated bonds remained distressed beyond the various federal government interventions. Bordo and Duca (2021) further focus on the time series impact of the MLF announcement on yield spreads, and find that the MLF limited the growth of spreads by 5 to 8 percentage points. Li and Lu (2020) focus on the effects of shutdown announcements on offering yields (rather than trade prices) and find that initial offering yields increased in response to shutdowns and decreased following facility announcements. Both Bordo and Duca (2021) and Li and Lu (2020) are consistent with a view that the various facilities (the MLF in particular, according to Bordo and Duca) played a significant role in calming the municipal market. But as noted, the close timing of many of the facility and other policy announcements makes separating their effects in the aggregate difficult.

In a novel approach to this problem, Haughwout, Hyman, and Shachar (2021) combine the time series and cross-sectional variations in availability of MLF funding to identify the effect of the facility on bond yields, issuance, ratings downgrades, and local public sector employment. The facility's population cutoffs for county and city issuers (500,000 and 250,000, respectively) were relatively arbitrary figures generally intended to limit the facility's eligibility to a manageable number of potential counterparties.

After demonstrating that counties and cities just above and just below these cutoffs are quite similar fiscally prior to the announcement of the MLF, Haughwout, Hyman, and Shachar (2021) look for differences in outcomes based on facility access. The headline result is that conditions overall improved after the MLF was announced, but the improvement was uneven across the credit rating distribution, and for the lowest-rated city and county issuers, which are here measured as those with ratings of A or BBB, actual eligibility to borrow at the facility translated into lower secondary market yields. The authors attribute this eligibility effect to a reduction in downgrade or default risk for these issuers, as they would be differentially able to remain liquid thanks to the option to borrow from the MLF. These authors also find a modest effect of MLF eligibility on primary market issuance, particularly among low-rated municipalities. Their test for effects of eligibility on the probability of a ratings downgrade also suggests a modest MLF effect, with downgrades rarer for issuers that had the option to receive funding from the MLF. Between March and November 2020, the number of bonds by cities and counties just below the population cutoff rose from 100 to 600, while they went from 100 to about 200 over the same period for

issuers just above the cutoff. In this case, the MLF eligibility effect was not related to the starting level of credit risk but, given the relative rarity of ratings changes, it is not estimated precisely.

A final contribution of Haughwout, Hyman, and Shachar (2021) is their attempt to identify the effect of MLF eligibility on local government employment. While the authors are able to demonstrate clearly that the largest cities and counties reduced employment by less than their slightly smaller counterparts, they are unable to attribute this difference to the MLF. The CARES Act's Coronavirus Relief Fund, which as noted above made \$150 billion in grants to many of the same governments, acts as a confounder here, and the authors conclude after a series of tests that the fund appears more likely than the MLF to have driven the employment results.

5. DISCUSSION AND CONCLUSION

The rapid healing of the municipal securities market after its sharp deterioration, along with the overall improvement in the fiscal health of state and local governments, is a clear success story of the pandemic policy response. Nonetheless, as of mid-2021, the state and local government sector had still not recovered to its pre-pandemic employment level. Indeed, employment as of May 2021 remained more than a million jobs (about 6 percent) below its pre-pandemic peak of February 2020 and has shown little sign thus far of a substantive recovery despite a substantial brightening of the fiscal outlook for the sector. It seems probable that some of this weakness is attributable to caution in a sector that was hit hard in the 2007-09 recession and its aftermath. Further, as noted above, the fact that many of these job losses have been concentrated in education suggests that there may be a nonfiscal reason for them, as in-person schooling was not feasible for most of the 2020-21 school year, leading to greatly reduced need for nonteaching staff such as bus drivers and cafeteria workers.

Given its focus on the ability of municipal issuers to access capital and liquidity, it is hard to resist the conclusion that the MLF was successful, if only as a component of a broad portfolio of policy interventions: record issuance at low interest rates suggests an issuer-friendly environment for much of 2020 and into 2021. How much credit the MLF deserves for this outcome is debatable, but market participants and the relevant academic literature provide evidence that some credit is due. Certainly, the MMLF was an important secondary market complement to the MLF's primary market focus. Indeed, some observers asked whether the Federal Reserve should have designed a secondary market facility for municipal debt, analogous to the Secondary Market Corporate Credit Facility.³¹ While the MLF was always focused on the primary market, the original (April 9) announcement of the MLF stated:

In addition to the actions described above, the Federal Reserve will continue to closely monitor conditions in the primary and secondary markets for municipal securities and will evaluate whether additional measures are needed to support the flow of credit and liquidity to state and local governments.³²

Some observers interpreted this sentence to mean that the Federal Reserve would establish a secondary market facility if needed for liquidity purposes, a need that ultimately did not materialize in the judgment of policymakers.

Nonetheless, the MLF had very low take-up, especially relative to the size of the market it was designed to support and relative to the announced size of the facility. This outcome was the subject of considerable discussion at a Congressional Oversight Commission hearing where some policymakers criticized the facility's limited eligibility and penalty pricing as overly blunting its impact.³³

The initial concern was that a facility of this type—directly lending in a market in which the Federal Reserve had never participated and had little expertise, and which consisted of a very large number of heterogeneous issuers—could easily be overwhelmed by demands for funds. This consideration led to strict eligibility limits both in terms of issuers and tenors, limits that were slowly relaxed over the subsequent revisions to the term sheet. At the same time, the adoption of a pricing schedule at penalty rates (as required by law) in the face of a stabilizing market environment made the MLF uneconomic to the vast majority of borrowers who were eligible. A reasonable conclusion to draw from this set of facts is that, even in a market with many issuers, penalty pricing acts as a significant deterrent to facility utilization—meaning that complex eligibility criteria may further complicate the Federal Reserve's ability to deliver funding where it is most needed. Further research on this topic is warranted, specifically focused on the price elasticity of demand for short-term borrowing by municipal issuers in an environment of fiscal stress. Given the size and heterogeneity of the issuer population in the municipal market, policymakers would need to know the elasticity on both the extensive margin (how many new issues would be made at price X?) and the intensive margin (how much would be borrowed at price X?). Estimates of these elasticities are important inputs into the design of a future facility like the MLF and could greatly simplify and streamline decisions about eligibility and borrowing limits by linking them with the setting of the penalty prices.

The challenge, of course, is identifying price shocks exogenous to borrower characteristics that can allow causal estimation of the effect of prices on issuance. Using their regression discontinuity design, Haughwout, Hyman, and Shachar (2021) estimate that among city and county issuers rated A/BBB, MLF eligibility caused a 75 basis point (or about 25 percent) reduction in yields. This exogenous variation in pricing, which is admittedly rare, might be used to identify the effects of prices on yields. In the paper, Haughwout, Hyman, and Shachar estimate some issuance response by A/BBB issuers, on both the extensive and intensive margins. The point estimate suggests elastic demand, but the sample sizes are very small: only five A/BBB cities or counties issued public debt in the six months following the April 27 expansion of the facility, four of which were eligible to borrow at the MLF.³⁴ These estimates have the advantage of being well-identified but suffer from a lack of precision and the fact that they are drawn from a sample of low-rated issuers, a thin part of the issuer population. Future work could focus on refining and expanding analysis along these lines.

A second lesson learned from the MLF experience is that investors, perhaps not surprisingly, appear to have placed a high value on facility eligibility by lower-rated borrowers. In the end, the MLF lent to just two borrowers: the state of Illinois (the lowest-rated state government) and the MTA, a relatively low-rated revenue bond issuer. Further, Haughwout, Hyman, and Shachar's (2021) results suggest that secondary market investors perceived a lower default risk for A/BBB cities and counties with facility access than for those without. The notion that the greatest benefit of access to Federal Reserve lending accrues to riskier borrowers suggests a potential for credit risk sharing or a change in the "normal" allocation of credit attributable to such a facility. The welfare implications of public sector risk sharing

or credit allocation are complex, especially when considerations of equity among the constituencies of various subnational public sector entities are included. Further research is required to understand these implications, as well as the relationship between access to liquidity and welfare in these areas.

A corollary concern is moral hazard. Borrowers might expect the Federal Reserve to reestablish such a facility if similar market dysfunction were to occur again, inducing borrowers to take more risk today. Bordo and Duca (2021) review past episodes in the United States and in other countries where state and local governments have not internalized borrowing risks due to previous national bailouts, which then resulted in a wave of defaults when such bailouts have failed to be realized.

Some characteristics of the pandemic context and the facility itself may serve to mitigate these moral hazard concerns to some degree. First, the pandemic was a unique event, with effects across the entire spectrum of municipal borrowers and indeed the entire economy. As Chair Powell testified in December 2020: “These programs serve as a backstop to key credit markets and have helped restore the flow of credit from private lenders through normal channels. We have deployed these lending powers to an unprecedented extent.”³⁵ Second, the MLF’s very low take-up rate appears to have been induced in part by the combination of eligibility restrictions and penalty pricing, suggesting that for the vast majority of municipal bond issuers it was not an attractive option compared to private markets. Third, the improvements in overall market functioning that followed the introduction of the MLF and other federal interventions were slowest to appear for lower-rated issuers—those in the A and BBB market segments.

Of course, none of these mitigants is completely convincing and there remain reasons for concern over moral hazard. For example, under exactly what future circumstances the Federal Reserve might again intervene in the municipal bond market is unknown, and it is possible that municipal budget officials will be overly optimistic about the probability of a future intervention of this sort in any number of scenarios. Further, these officials could imagine that a future version of the facility might be designed to be a more attractive option to individual borrowers, and/or to provide more immediate support to the bottom of the ratings distribution. Our conclusion, then, is that once a new kind of backstop lending has been introduced, and the MLF certainly fits that description, the issue of moral hazard can never be satisfactorily resolved *ex ante* but will require further monitoring.

A final point is the elusive relationship between access to liquidity and real economic outcomes like state and local government employment. In the 2020 recession, unlike the 2007-09 downturn, state and local governments shed jobs very quickly, and thus far the recovery has been tepid—this in spite of unprecedented interventions in the credit market, including the MLF, and large fiscal transfers. Whether the MLF had any positive impact on real outcomes, including capital investment or service delivery more generally, is a third area for additional research. This is of course a key question, one that will require better data and perhaps new research designs to untangle.

NOTES

Acknowledgments: The authors are grateful for comments from the editor, an anonymous referee, Won Chai, Anna Kovner, Timothy Little, Byron Lutz, Susan McLaughlin, and Jennifer Wolgemuth.

¹ For the purposes of this article, we will use broad terms like “state and local government sector,” “state and local governments,” “municipal issuers,” and “municipalities” to refer to the vast array of subnational governmental entities in the United States, including states, cities, counties, transit agencies, and school districts, among others.

² This is not to say that such bonds can never be used to help fund current operations. For example, bonding against tobacco settlement payments or pension obligation bonds can be used as means to reduce near-term budget pressures. See Calabrese and Ely (2013) and Johnson (2004). State and localities can also use rainy day funds and accounting maneuvers of various sorts to smooth their spending through recessions.

³ See Bernanke (2020).

⁴ By mid-autumn, unemployment was down to 6.7 percent and it had become clear that the most dire scenario for the sector was less likely.

⁵ Bruce and Fox (2000) point out the relatively heavy taxation of goods versus services in state sales tax systems.

⁶ “Own-source” revenues are those collected by the entity in question, as opposed to those transferred from other governments.

⁷ Indeed, by the end of fiscal year 2021, thanks to an improving economy and aid under the American Rescue Plan, many states and localities were proposing spending increases and/or tax cuts. See the Urban Institute’s “How the COVID-19 Pandemic Is Transforming State Budgets,” <https://www.urban.org/policy-centers/cross-center-initiatives/state-and-local-finance-initiative/projects/state-fiscal-pages-covid-edition>.

¹³ The MLF was one component of a very broad suite of programs intended to respond to the pandemic’s effects on the economy; some of those programs also provided aid to state and local governments. For example, the CARES Act also established a Coronavirus Relief Fund that provided direct grants to states and large localities. The breadth of these programs increases the challenge of isolating the effect of the MLF, as we will discuss below.

¹⁵ Over a quarter of local government revenue in fiscal year 2017 was intergovernmental aid from state governments. This “downstream” funding is also similar in spirit to the support a “proactive” state will give to a financially distressed municipality under its jurisdiction (Gao, Lee, and Murphy 2019). Other states, however, allow unconditional access to Chapter 9 bankruptcy procedure, preferring to leave the municipalities to manage their own affairs in a period of fiscal stress.
