OIL PRICE DYNAMICS REPORT

Updated: May 18, 2020

Oil prices rose over the past week owing to decreased supply.

- Over the past week, a decline in anticipated supply as well as a reversal in the residual offset a decrease in demand expectations, resulting in higher oil prices. In 2020:Q1, oil prices plummeted owing to decreased demand and increased supply.
- Oil prices rose in 2019:Q1 due to increasing demand expectations, whereas in 2019:Q2-Q3 higher anticipated supply drove prices down. In 2019:Q4, oil prices rose owing to improving demand expectations.
- Overall, between 2014 and 2017, both lower global demand expectations and higher anticipated supply held oil prices down. Since mid-2017, this trend reversed as stronger demand expectations and stabilizing anticipated supply drove oil prices higher. This lasted until 2018:Q4 when weaker demand lowered prices.

Our analysis of oil price movements does not necessarily represent the views of the Federal Reserve Bank of New York, the Federal Reserve System, or the Federal Open Market Committee.

Cumulative Weekly Decomposition, Jan 03-May 15, 2020

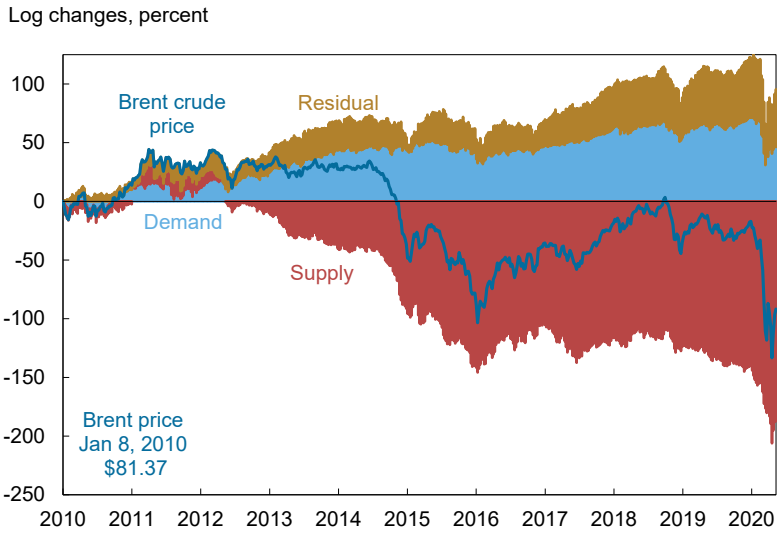
Notes: Residual reflects price movements unexplained by supply and demand factors. Supply, demand, and residual sum to Brent crude price.

Cumulative Weekly Decomposition, 2010-Present



Sources: Authors' calculations; Haver Analytics; Thomson Reuters; Bloomberg L.P.
Notes: Residual reflects price movements unexplained by supply and demand factors. Supply, demand, and residual sum to Brent crude price.

Recent Decomposition Data

- The chart at left depicts the cumulative oil price decomposition from January 3, 2020.
- The table below presents the most recent cumulative values.

Cumulative Percentage Changes since January 3, 2020

	Demand	Supply	Rest	Brent
May 01, 2020	-27.1	-55.4	-12.8	-95.3
May 08, 2020	-23.6	-48.4	-7.5	-79.5
May 15, 2020	-25.2	-47.6	-2.0	-74.7

Longer-Term View of Oil Price Movements

- This final chart provides a somewhat longer-term perspective by means of a cumulative decomposition from 2010 onward.
- The analysis shows that excess supply became a significant driver of oil prices in mid-2012 and generally dominated price dynamics after mid-2014.

Oil Price Decomposition Q&A

1. What is the goal of the oil price decomposition?

Our aim is to determine how much of the observed oil price change has been driven by demand and supply factors.

2. What is the modeling strategy?

Using a statistical model and a large number of financial variables, we decompose weekly oil price changes into demand effects, supply effects, and an unexplained residual.

Sparse partial least squares regression allows us to construct linear combinations from the variables in our financial market data set—called factors—which have maximum explanatory content for oil price changes. We first use this procedure to generate factors that best capture the patterns in the data, and then examine the estimated factors to determine how they reflect demand or supply dynamics.

The model is re-estimated every week using weekly data from January 1986 through the close of business on Friday of the most recent week. Over this sample, the model can explain about two-thirds of the weekly oil price dynamics.

3. How to interpret the results?

The output of the model is used to decompose weekly changes in an accounting sense. More specifically, the weekly Brent crude price change always equals the change explained by demand factors plus the change explained by supply factors plus a residual (the weekly change unexplained by the sum of the estimated demand and supply factors).

Given the noise in weekly price changes, we choose to show the results as a cumulation from a certain starting point (usually the start of the previous quarter).
