

OIL PRICE DYNAMICS REPORT

Updated: August 15, 2022

Oil prices increased over the past week, owing to higher demand and lower supply

- Over the past week, a decrease in anticipated supply combined with an increase in demand expectations resulted in higher oil prices. In 2022:Q2, oil prices increased as decreased anticipated supply offset decreased demand expectations.
- In 2022:Q1, oil prices increased as decreased anticipated supply offset lower demand expectations. In 2021:Q4, oil prices decreased as increased anticipated supply outstripped the effect of an improving demand outlook. In 2021:Q3, oil prices rose owing to increased demand and decreased supply. Rising demand expectations were the main cause of higher oil prices in 2021:Q1 and 2021:Q2. In 2020:Q1, oil prices plummeted owing to decreased demand and increased supply, while in 2020:Q2, oil prices rose owing to increased demand. Increased supply led to falling oil prices in 2020:Q3. This reversed in 2020:Q4, as oil prices rose owing to increased demand and decreased supply.
- Overall, between 2014 and 2017, lower global demand expectations and higher anticipated supply held oil prices down. This trend has reversed since mid-2017, as stronger demand expectations and stabilizing anticipated supply drove prices higher. This lasted until 2018:Q4, when weaker demand lowered prices. Oil prices rose in 2019 due to increasing demand expectations.

Our analysis of oil price movements does not necessarily represent the views of the Federal Reserve Bank of New York, the Federal Reserve System, or the Federal Open Market Committee.

Cumulative Weekly Decomposition, Apr 01-Aug 12, 2022

Sources: Authors' calculations; Haver Analytics; Thomson Reuters; Bloomberg L.P.
 Notes: Residual reflects price movements unexplained by supply and demand factors.
 Supply, demand, and residual sum to Brent crude price.

Cumulative Weekly Decomposition, 2010-Present

 Notes: Residual reflects price movements unexplained by supply and demand factors.
 Supply, demand, and residual sum to Brent crude price.

Recent Decomposition Data

- The chart at left depicts the cumulative oil price decomposition from April 1, 2022.
- The table below presents the most recent cumulative values.

Cumulative Percentage Changes since April 1, 2022

	Demand	Supply	Rest	Brent
Jul 29, 2022	-8.3	14.0	-0.5	5.2
Aug 05, 2022	-10.7	6.0	-4.9	-9.5
Aug 12, 2022	-6.3	9.5	-9.3	-6.2

Longer-Term View of Oil Price Movements

- This final chart provides a somewhat longer-term perspective by means of a cumulative decomposition from 2010 onward.
- The analysis shows that excess supply became a significant driver of oil prices in mid-2012 and generally dominated price dynamics after mid-2014.

Oil Price Decomposition Q&A

1. What is the goal of the oil price decomposition?

Our aim is to determine how much of the observed oil price change has been driven by demand and supply factors.

2. What is the modeling strategy?

Using a statistical model and a large number of financial variables, we decompose weekly oil price changes into demand effects, supply effects, and an unexplained residual.

Sparse partial least squares regression allows us to construct linear combinations from the variables in our financial market data set—called factors—which have maximum explanatory content for oil price changes. We first use this procedure to generate factors that best capture the patterns in the data, and then examine the estimated factors to determine how they reflect demand or supply dynamics.

The model is re-estimated every week using weekly data from January 1986 through the close of business on Friday of the most recent week. Over this sample, the model can explain about two-thirds of the weekly oil price dynamics.

3. How to interpret the results?

The output of the model is used to decompose weekly changes in an accounting sense. More specifically, the weekly Brent crude price change always equals the change explained by demand factors plus the change explained by supply factors plus a residual (the weekly change unexplained by the sum of the estimated demand and supply factors).

Given the noise in weekly price changes, we choose to show the results as a cumulation from a certain starting point (usually the start of the previous quarter).
