

# Electronic Communications Networks and Liquidity on the Nasdaq

James P. Weston

Jones School of Management

Rice University

# Background / Motivation

- Electronic Communications Networks have been growing exponentially
- Technological change has reduced search costs – leading to disintermediation
- ECN's are fast, cheap, and anonymous

# Background / Motivation

- How has the growth of trading over ECNs affected:
  - Competition on the Nasdaq?
    - Trading costs
    - market concentration
  - Liquidity on the Nasdaq ?
    - Spreads
    - Depths

# Previous Problems on Nasdaq

- Evidence of Imperfect Competition on Nasdaq
  - Christie and Schultz (JF 1994)
  - Weston (JF 2000)
- New Regulations help ECNs
- How have ECNs affected Competition ?

# What are ECNs ?

- Electronic trading systems that use automated software to match buyers and sellers
  - Either internally or
  - Routed to Nasdaq
- *Currently* regulated as brokers

# What makes ECNs different?

- Unlike Traditional Nasdaq dealers, ECNs are AGENTS
- ECNs commit no capital
- ECNs charge an agent's fee (Nasdaq dealers cannot charge such a fee)
- Face no inventory / information costs

# What drives the growth of ECNs ?

- Investors trade Directly
- Electronic limit order book
- Fast execution
- Anonymity

# ECNs are anonymous

- Nasdaq dealers may know the identity of the counter-party
- ECN trading is completely anonymous
- Great benefit to institutional investors

# ECNs increase transparency

- Display orders off of the inside quotes
- Allows investors to access limit order book
- However – not a C.L.O.B.

The screenshot shows a window titled "Island book snapshot for msft - N...". The window contains a table with two main sections: "BUY ORDERS" and "SELL ORDERS". Each section has columns for "SHARES" and "PRICE". The data is as follows:

BUY ORDERS		SELL ORDERS	
SHARES	PRICE	SHARES	PRICE
<u>1,000</u>	55.4531#	<u>1,925</u>	55.5586#
<u>220</u>	55.4375	<u>100</u>	55.5625
<u>843</u>	55.3750	<u>100</u>	55.6094#
<u>200</u>	55.3750	<u>600</u>	55.6250
<u>1,000</u>	55.3125	<u>200</u>	55.6250
<u>1,700</u>	55.2500	<u>1,000</u>	55.9375
<u>200</u>	55.1250	<u>85</u>	56.0000
<u>1,700</u>	55.1250	<u>1,000</u>	56.1094#
<u>100</u>	55.1000	<u>400</u>	56.5000
<u>10</u>	55.1000	<u>500</u>	56.7500
<u>60</u>	55.0625	<u>500</u>	56.9375
<u>1,000</u>	55.0625	<u>2</u>	57.0000

# Major Players

- Instinet (Reuters)
  - High level of liquidity
  - Oldest and largest
  - Focus on Institutional Traders
- Island (Datek)
  - Technically sophisticated (open limit order book)
  - Retail and Day-traders
- Others
  - Archipelago, RediBook, Bloomberg Trade book

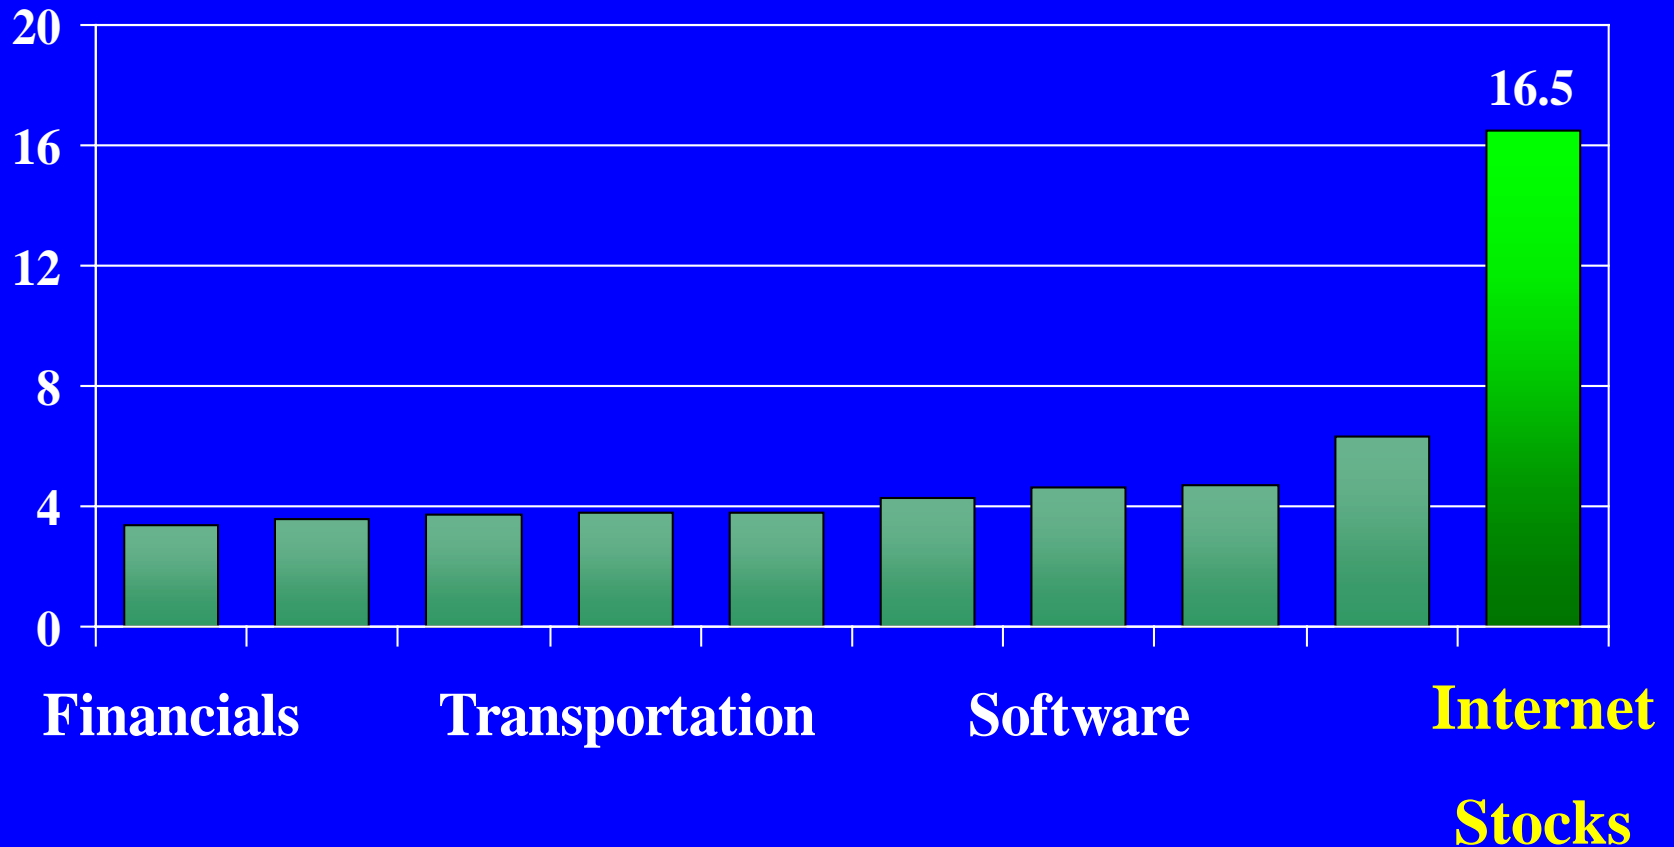

# Market Share by ECN

ECN	Share of Nasdaq Volume (%)	
	1998	1999
Instinet	2.5	3.0
Island	0.8	4.9
Redi-Book	0.1	0.7
Bloomberg	0.4	0.6
All Others	0.1	0.5
Total	3.8	9.7

# ECN Market Share by Volume Decile

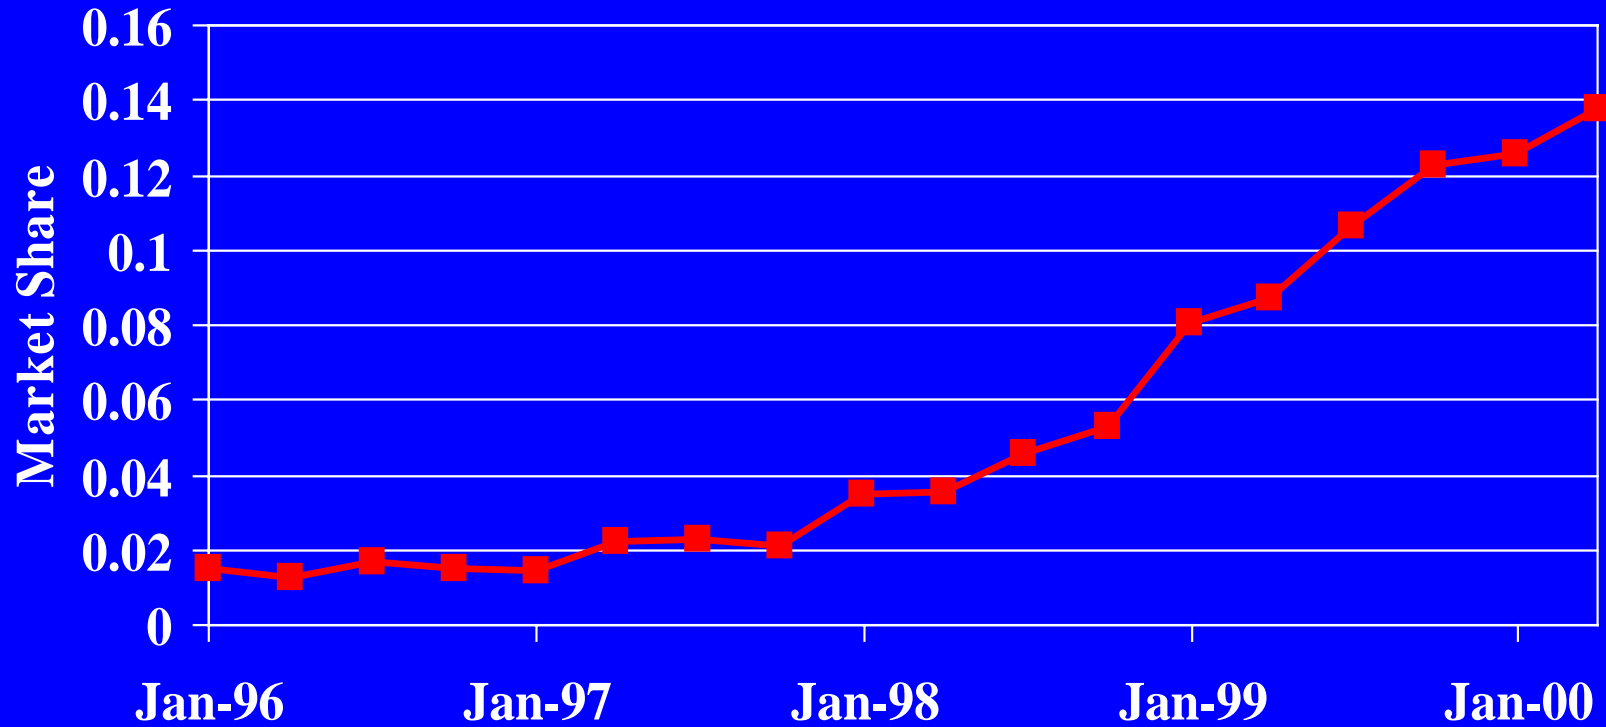

# Market Share : By Industry (1999)

# The Growth of ECNs

Market share of reported ECN volume

# The Decline in Nasdaq Spreads

Average Quoted Spread for All Nasdaq Stocks

# Is There a Relationship ?

## Time Series of Nasdaq Spreads and ECN activity

# Previous Research on ECNs

- Hendershott and Mendelson (forthcoming JF)
  - Positive liquidity effect of ECNs
  - Negative crowding effect
- Simaan, Weaver and Whitcomb (WP 1998)
  - ECN's are more likely to post odd-teen quotes
- Huang (WP 2000)
  - ECNs contribute to price discovery

# Contributions of this Paper

- Few academic studies on ECNs
- Are ECNs competing with Nasdaq dealers ?
- Do ECNs improve the liquidity of the Nasdaq?

# Data / Sample

- All Nasdaq firms
- Monthly market maker volume obtained from Nasdaq
- Firm Characteristics from CRSP

# Research Design

- Does the level of ECN activity affect liquidity for Nasdaq stocks?
- Control for other factors that might have an effect on liquidity
- Two methods:
  - Linear Regression
  - Matched Sampling

# Effect of ECNs on Liquidity (Linear Regression)

$$\begin{aligned} \text{Liquidity}_{i,t} &= \alpha + \beta_1 \ln(\text{ECNshare})_{i,t} \\ &+ \beta \text{Controls}_{i,t} + \varepsilon_{i,t} \end{aligned}$$

**H<sub>0</sub>:  $\beta_1 = 0$**  (ECNs have no affect on Liquidity)

**H<sub>1</sub>:  $\beta_1 > 0$**  (ECNs increase Liquidity)

# Effect of ECNs on Liquidity

Liquidity is measured as:

- Spread
- Depth
- Market Concentration (HHI)

Control variables are: Price, Volume, Volatility, and HHI

# Effect of ECNs on Liquidity

(What do we expect for  $\beta$  ?)

	Quoted Spread	Relative Spread	Depth	HHI
<b>ECN share</b>	<b>?/-</b>	<b>?/-</b>	<b>?/+</b>	<b>?/-</b>
<b>Price</b>	<b>-</b>	<b>?</b>	<b>+</b>	<b>?</b>
<b>Volume</b>	<b>-</b>	<b>-</b>	<b>+</b>	<b>-</b>
<b>Volatility</b>	<b>+</b>	<b>+</b>	<b>-</b>	<b>?</b>
<b>HHI</b>	<b>+</b>	<b>+</b>	<b>-</b>	<b>NA</b>

# Effect of ECNs on Liquidity

## Estimates of $\beta$

	Quoted Spread	Relative Spread	Depth	HHI
ECN share	<b>-1.6%</b>	<b>-1.6%</b>	<b>5.1%</b>	<b>-4.1%</b>
T-statistic	<b>-5.33</b>	<b>-5.33</b>	<b>12.75</b>	<b>-10.25</b>
R <sup>2</sup>	<b>0.91</b>	<b>0.88</b>	<b>0.58</b>	<b>0.26</b>

# Effect of ECNs on Liquidity

- Based on the linear regression, we find that an increase in ECN activity:
  - Decreases spreads
  - Increases Depth
  - Decreases Market Concentration

# Second Methodology

## Matched Sample

- Nonlinearities / Endogeneity problems in the regression.
- Use a method that does not rely on regression
- **Match** firms based on **Price, Volume, Volatility**.

# Second Methodology

## Matched Sample

- Take each pair of firms:
  - Assign each firm to High or Low ECN-share portfolio.
- Test Differences in **Portfolios**.
- We expect that firms in the High ECN-share portfolio have: **lower spreads, greater depths and are less concentrated.**

# Portfolio Percentage Differences

( $HIGH_{ECN\ share} - LOW_{ECN\ share}$ )

	<b>ECN Share</b>	<b>Spreads</b>	<b>Depth</b>	<b>HHI</b>
<b>All Pairs</b>	<b>103%</b>	<b>-2.6%</b>	<b>3.6%</b>	<b>-15.3%</b>
<b>Small Diff.</b>	<b>35.3%</b>	<b>-1.1%</b>	<b>1.9%</b>	<b>-7.8%</b>
<b>Large Diff.</b>	<b>171%</b>	<b>-3.8%</b>	<b>5.9%</b>	<b>-22.5%</b>

# Conclusions

- ECN's Market share has grown exponentially over the past 4 years
- ECN's lower spreads, increased depth and decrease market concentration.
- Overall, ECNs improve liquidity on the Nasdaq.

# Caveats

- What happens to ECN liquidity during a market crisis.
- Are ECNs unfairly benefiting from an SEC loophole?
- Will ECNs get **CLOB**bered

# Extensions / Future Work

- Distinguish effects by type of ECN
- Market Maker Entry / Exit
- Anonymity
